

ITF23019: Parallel and Distributed Programming

Report for Lab 7: Thread Synchronization 2

Name: Emil Berglund

GitHub: EmilB04

Exercise 1: Complete the code

Subtask 1: In Main class, create thread1 and thread2 in sequence. Thread1 executes doTaskA() and Thread2 executes doTaskB().

- Done. See code in folder *exercise1_2* and under *src/Exercise1.java*

Subtask 2: Use Conditional Variables to synchronize thread1 and thread2 so that the output of the program is in the PDF.

- Done. See code in folder *exercise1_2* and under *src/Exercise1.java*

Exercise 2: Complete the code

Do the same thing with Exercise1. However, use Semaphores to synchronize two threads instead of using Conditional Variables.

- Done. See code in folder *exercise1_2* and under *src/Exercise2.java*

Exercise 3: Complete the code

Your task in this Exercise is to complete the implementation by using Barrier to synchronize threads so that the meeting will start only when all participants have arrived. The missing code in the project is marked with // TODO keywords. Expected output is in the PDF

- Done. See code in folder *exercise3*
